Climate Change: Global Temperature

We study the global temperatures dataset available on:

<https://www.kaggle.com/berkeleyearth/climate-change-earth-surface-temperature-data>

We focus on the time series 'LandAverageTemperature', which is the monthly global average land temperature in Celsius. We take its yearly averages and only use the data from 1850-2015. Previously, in master.ipynb, we performed some preliminary data analysis. The first difference of this series is stationary. We fitted baseline AR(3) models, using fixed partitioning and rolling forecast.

In this notebook, we create lag features and fit LSTM models on the series, using fixed partitioning and rolling forecast, and compare the model performance with each other, and with the baseline AR(3) models.

Preamble

```
In [1]: import pandas as pd
# Make the output look better
pd.set_option('display.max_rows', 500)
pd.set_option('display.max_columns', 500)
# pd.set_option('display.width', 1000)
pd.options.mode.chained_assignment = None # default='warn' # ignores warning about dropping columns inplace

import numpy as np
import seaborn as sn
import matplotlib.pyplot as plt

import os
os.chdir(r'C:\Users\Cedric Yu\Desktop\Works\13_time_series_global_temperatures')

### tensorflow

```

Rolling forecast

To mimic real-world deployment, we perform rolling forecast on the first difference. The first split is again at 1986-12-31. At each time step, we use as training set the ground truth from the previous time steps, which is re-shuffled to eliminate sequence bias. The training set is used to fit an LSTM model which has the same architecture as model_diff used above in fixed partitioning. Without using a validation set (which would involve peeking into future data) during model training, we train it for 1500 epochs; that is the ballpark which the fixed-partitioning model reached the lowest validation MAE.

```
In [134... # split_time = pd.Timestamp(1986,6,30)
temperature_yearly_diff.index[131]
```

```
Out[134... Timestamp('1986-12-31 00:00:00', freq='A-DEC')
```

```
In [176... from tqdm import tqdm    # fancy progress bar for the for-loop
size = 131

# ground truth (first difference and lags) from past time steps
history_diff_rolling = temperature_yearly_diff_train.to_numpy().copy()
# ground truth (first difference and lags) at present/future time steps
